Chatbot: A Retreival based chatbot built using NLTK, Keras, Python, etc.

The chatbot is trained is on the dataset with contains intents (behind the customer response), patterns and response. The model used to train this chatbot is called recurrent neural network (LSTM) to classify which category the user's message belongs to and the bot gives a random message out of list of responses.

How to Use

1. Train the model using

                 python train_chatbot.py

2. Then execute the gui file to get the interactive screen

                 python chatgui.py
